

In the Claims

1-9. (cancelled)

10. (new) A process for producing adhesion elements on a substrate, comprising the steps of:

introducing plastic material into at least one shaping element; and

forming the plastic material into adhesion elements with flared ends accomplishing adhesion predominantly by van-der-Waals forces, the flared ends forming heads with essentially flat end surfaces.

11. (new) A process according to claim 10 wherein

the plastic material is selected from the group consisting of inorganic and organic elastomers, polyvinyl siloxane, and additional-crosslinking silicone elastomers in binary systems and acrylates.

12. (new) A process according to claim 10 wherein

the plastic material is thixotropic, and has a viscosity of 7,000 to 15,000 mPas measured with a rotary viscosimeter.

13. (new) A process according to claim 12 wherein

the viscosity is approximately 10,000 mPas at a shear rate of 10 1/sec.

14. (new) A process according to claim 10 wherein
the shaping element is a drum-shaped screen having at least 10,000 mold cavities per cm^2 .
15. (new) A process according to claim 14 wherein
the shaping element has 16,000 mold cavities per cm^2 .
16. (new) A process according to claim 14 wherein
each of the mold cavities has a hyperboloid shape.
17. (new) A process according to claim 10 wherein
the plastic material has a contact angle greater than 60 degrees due to surface energy for wetting with water.
18. (new) A process according to claim 17 wherein
the contact angle is greater than 70 degrees.
19. (new) A process according to claim 10 wherein
the adhesion elements have stem parts with a height from 50 μm to 150 μm and with a diameter from 10 μm to 40 μm , and have flared ends with a diameter from 15 μm to 70 μm .
20. (new) A process according to claim 19 wherein
the height of the stems is approximately 90 μm ;

the diameter of the stems is approximately 30 μm ; and

the diameter of the flared end is approximately 50 μm .

21. (new) A process according to claim 10 wherein

the plastic material is cross-linked with or after molding of the adhesion elements.

22. (new) A process for producing adhesion elements on a substrate, comprising the steps of:

introducing plastic material into at least one shaping element; and

forming the plastic material into adhesion elements with flared ends accomplishing adhesion predominantly by van-der-Waals forces, the flared ends forming heads with slightly convex end surfaces.

23. (new) A process according to claim 22 wherein

the plastic material is selected from the group consisting of inorganic and organic elastomers, polyvinyl siloxane, and additional-crosslinking silicone elastomers in binary systems and acrylates.

24. (new) A process according to claim 22 wherein

the plastic material is thixotropic, and has a viscosity of 7,000 to 15,000 mPas measured with a rotary viscosimeter.

25. (new) A process according to claim 24 wherein
the viscosity is approximately 10,000 mPas at a shear rate of 10 1/sec.
26. (new) A process according to claim 22 wherein
the shaping element is a drum-shaped screen having at least 10,000 mold cavities per
cm².
27. (new) A process according to claim 26 wherein
the shaping element has 16,000 mold cavities per cm².
28. (new) A process according to claim 26 wherein
each of the mold cavities has a hyperboloid shape.
29. (new) A process according to claim 22 wherein
the plastic material has a contact angle greater than 60 degrees due to surface energy for
wetting with water.
30. (new) A process according to claim 29 wherein
the contact angle is greater than 70 degrees.
31. (new) A process according to claim 22 wherein
the adhesion elements have stem parts with a height from 50 µm to 150 µm and with a
diameter from 10 µm to 40 µm, and have flared ends with a diameter from 15 µm to 70 µm.

32. (new) A process according to claim 31 wherein
the height of the stems is approximately 90 μm ;
the diameter of the stems is approximately 30 μm ; and
the diameter of the flared end is approximately 50 μm .
33. (new) A process according to claim 22 wherein
the plastic material is cross-linked with or after molding of the adhesion elements.
34. (new) A process for producing adhesion elements on a substrate, comprising the steps of:

introducing plastic material into at least one shaping element; and

forming the plastic material into adhesion elements with flared ends accomplishing adhesion predominantly by van-der-Waals forces, the flared ends forming heads with end surfaces having a concavity.
35. (new) A process according to claim 34 wherein

the plastic material is selected from the group consisting of inorganic and organic elastomers, polyvinyl siloxane, and additional-crosslinking silicone elastomers in binary systems and acrylates.

36. (new) A process according to claim 34 wherein
the plastic material is thixotropic, and has a viscosity of 7,000 to 15,000 mPas measured
with a rotary viscosimeter.

37. (new) A process according to claim 36 wherein
the viscosity is approximately 10,000 mPas at a shear rate of 10 1/sec.

38. (new) A process according to claim 34 wherein
the shaping element is a drum-shaped screen having at least 10,000 mold cavities per
cm².

39. (new) A process according to claim 38 wherein
the shaping element has 16,000 mold cavities per cm².

40. (new) A process according to claim 38 wherein
each of the mold cavities has a hyperboloid shape.

41. (new) A process according to claim 34 wherein
the plastic material has a contact angle greater than 60 degrees due to surface energy for
wetting with water.

42. (new) A process according to claim 41 wherein
the contact angle is greater than 70 degrees.

43. (new) A process according to claim 34 wherein
the adhesion elements have stem parts with a height from 50 μm to 150 μm and with a
diameter from 10 μm to 40 μm , and have flared ends with a diameter from 15 μm to 70 μm .

44. (new) A process according to claim 43 wherein
the height of the stems is approximately 90 μm ;
the diameter of the stems is approximately 30 μm ; and
the diameter of the flared end is approximately 50 μm .

45. (new) A process according to claim 34 wherein
the plastic material is cross-linked with or after molding of the adhesion elements.
